

ABSTRACT

A system and method is disclosed for a clinician to obtain information wherein two user interface flows can be integrated together. One user interface flow originates from a validated computer and the other user interface flow originates from a non-validated computer wherein Web pages from the non-validated computer are routed into a conduit residing in the validated computer. Web pages that do not necessitate interaction with the validated computer are routed unmodified to a user terminal. Further, Web pages that do necessitate interaction are indicated as such by the non-validated computer wherein these pages are merged with information originating from the validated computer and then routed to the user terminal.
